## Plugwise Template Engine

| Title | Plugwise Template Engine |
| :---: | :---: |
| Version | 2.20 |
| Date | 2011-10-06 |
| Product | Source/PTE |
| Author | TVR |
| Notes | This is an experimental feature and is not considered as required functionality. There will not be any support from the Plugwise helpdesk. |
| Bugs | Please report your remarks and bugs to helpdesk@plugwise.com |
| Changes | 0.94: While loop statement added <br> 0.95: PlugwiseServer.exe added <br> 0.96: File object added, additional properties for System object. <br> 2.00: Big performance improvements <br> 2.01: Added switching and usage members to Group en Room <br> 2.02: Added Type and TypeText to Room <br> 2.10: CRUD functionality for existing and new Plugwise classes <br> 2.11: 'ELSE IF' is treated as 'ELSEIF'. <br> A ' $\backslash n$ ' in a script file is always treated as a EOLN, with or without a ' $\backslash r$ '. Implementation of functions (blocks are considered obsolete now) <br> Functions can also be used to add custom methods to existing classes. <br> 2.12: Support for sessions through non volatile array 'Request. Session'. RegExp en Http classes added Apache style access logging <br> AutoScript and AutoScriptInterval for periodically automated scripts File extension.PTE is supported so editors can recognize script files <br> 2.13: Added to Array: Avg(), Sum(), Max(), Min(), Sort(), SortByKey(), <br> Remove(), RemoveAt(), RemoveByKey() <br> $\log ()$ added to Appliance, Group and Room <br> Multi line comments using /* and */ <br> Added to DateTime: AddSeconds(), AddMinutes(), AddHours(), <br> AddDays(), AddMonths(), AddYears() <br> 2.14: Added to Module: FirmwareDate, FirmwareVersion, HardwareVersion Added to Network: GetModuleList() Added to System: LanAdapters <br> 2.15: Web server is now multi threaded Changed /sys/mimetypes.txt so html output is considered to be utf-8. Icons of /pwimg/ are transparent PNG's Power usage graphs can be generated via /pwgraph/ Added to System: Execute(), ResetTimer() <br> Added PowerState to Group and Room <br> Added SetSchedule() to Appliance, Group and Room <br> Added to Plugwise: Currency, FeatureFlags, License, Personallnfo, Register(), Restart(), ScanPorts(), SetLicense(), SetPersonallnfo() <br> Added PeakDaysOfWeek and SetPeakDaysOfWeek() to Tariff <br> 2.16: New type 'Undefined' added. <br> Changed type of unexisting array element to 'Undefined' instead of an empty string. Added \|| operator to Array, DateTime, Float and String for default value assignments Added System.SetCompatibility() <br> Added 'emptyelement' compatibility flag <br> Added optional TariffType parameter to .Log() <br> Added To Plugwise: .LogData(), .ColorScheme(), SetColorScheme() <br> Support for hexadecimal values like '0x80ff80' <br> Documentation /pwimg/ and /pwgraph/ <br> Added Network.Quality <br> 2.17: Added Module.Temperature, Module.Humidity and Room.TemperatureAndHumidity for Sense. <br> 2.20: Implemented basic url rewriting with _catch404. pte <br> Added Request.Method <br> Added Group.SetBroadcast <br> Added Group.Type, Group.Typetext, Group.SetType() <br> Added Group.SetBroadcast() <br> Added .UUId to all Plugwise objects |

- Experimental and Preliminary -

|  | Added Trigger object <br> Added Plugwise.Backup() <br> Added Module.LastTelegram <br> Added .SetExtra and .GetExtra() |
| :--- | :--- |

## Introduction

The Plugwise Source application has a built in lightweight multi threaded web server with a simple object oriented template engine. This web server can be used to expose information on the Plugwise system and switch appliances remotely by means of HTML pages or XML feeds. Starting with version 2.1, full CRUD is supported, so you can change the configuration of the system via scripting.

Note: Whether the web server is available and which functionality is enabled depends on the license type of your Source application.

## Installation

The web server is part of the Source application and does not require a separate installation. It is automatically started if it is enabled in the Settings window, the given port number is available and the specified ' $w w w$ ' folder exists.
These settings can be bypassed by specifying an ini file in the command line with

```
/httpdini="path to ini"
```

Example:

```
; Example ini file
[server]
; port number to listen on
port=8080
; folder that contains the files to serve.
; it may be relative to the application startup folder
root=www
; user name for authentication
; if left blank, no authentication is required
user=admin
; MD5 hash of the password for authentication.
; the default is 'admin'
password=21232F297A57A5A743894A0E4A801FC3
; This script should be executed every 5 seconds
autoscript=dispatcher.pte
autoscriptinterval=5
[settings]
; Here you can specify your own configuration settings.
; Any parameter specified here is accessible within the scripts
; via the System.Settings array.
CompanyName=ACME inc.
CompanyColors=#ff00ff,#800080,#00FF00,#008000
```

There is also a dedicated application: PlugwiseServer.exe, which only runs the web server and does not have the user interface of the Source. PlugwiseServer uses the same command line parameters as Source.
Note: Source and PlugwiseServer cannot run at the same time.

## The Basics

Any file requested by a client (i.e. web browser) that has one of the extensions '.css', '.html', '.htm', '.txt', '.xml' or '.pte' is parsed by the template engine and any text enclosed by '<\%'
and '\%>' tags is interpreted as statements. All characters outside these tags and files with other extensions are literally passed through.

```
<html><body>
<%
    $mytext="Hello world"
%>
<h1><%=$mytext%></h1>
</body></html>
```

You can enclose multiple statements with the tags as long as they are separated by a line break (end of line) or a semicolon ';'.

```
<html><body>
<%
    $mytext="Hello world" // everything on this line behind the '//' is ignored.
    Echo "<h1>", $mytext, "</h1>"; $a=5; Echo $a
%>
</body></html>
```

The default page for any folder is 'index.pte' or 'index.html'.

## Handling of 404(_catch404.pte)

If a requested url does not exists a 404-Page-not-found error is returned unless the server finds a script called '_catch404.pte'. The server will try to find this file as deep in (the valid part of) the requested path as possible and then up to the root. If it finds it, the script is executed and the resulting url is handled instead of the requested.
Inside the script the original url is stored in \$_script and the script should change this variable to change the url to handle.
\$_script="index.html" // redirect any 404 to the index page
\%>

Except for session variables all variables are local and cannot be passed to other scripts.

## Variables

Variables are dynamic and weak typed, what means that you do not need to declare them and that they can change from one type to another depending on the last assignment. All variables are treated as objects although there is a distinction between the value types 'float', 'string' and 'bool' and reference types like 'array' or 'Appliance'. Value types have their value copied from one variable to another, while reference types get only a reference (pointer) to the object (their 'value').

```
<html><body>
<%
    $value1=1;
    $value2=$value1;
%>
Value1 = <%=$value1%><br>
Value2 = <%=$value2%>
<hr>
<%
    ++$value2;
%>
Value1 = <%=$value1%><br>
Value2 = <%=$value2%>
```

```
<hr>
<%
    $ref1={'One','Two'};
    $ref2=$ref1;
%>
Ref1[1] = <%=$ref1[1]%><br>
Ref2[1] = <%=$ref2[1]%>
<hr>
<%
    $ref1[1]='Changed';
%>
Ref1[1] = <%=$ref1[1]%><br>
Ref2[1] = <%=$ref2[1]%>
</body></html>
```

The output will look like:

```
Value1 = 1
Value2 = 1
```

Value1 = 1
Value2 $=2$
Ref1[1] = Two
$\operatorname{Ref} 2[1]=$ Two
Ref1[1] = Changed
Ref2[1] = Changed

When operators are used on 2 values of different types, the second value is converted to the same type as the first value.
For DateTime, Float and String variables the ' $\|$ ' operator (logical OR) has a special function: If the left value is Undefined, then the right value is used and the left value is ignored, otherwise the left value is used and the right value is ignored.
So instead of

```
$param=Request.Get["myparam"]
if $param == undefined
    $param='some default'
/if
```

You can use
\$param=Request.Get["myparam"] || 'some default'

## Casting

To assign a value to a variable of a different type for example a float to a (formatted) string you can use casting.

```
<%
    $f=12.345
    echo $f, ', ', String($f), ', ', String($f,'0.00'), '<br>'
    $d= DateTime('2007-06-01')
    echo $d, ', ', String($d), ', ', String($d,'yyyy MMM d'), '<br>'
    exit
%>
```

Result (depends on Windows' language and region settings):

```
12.345, 12.345, 12,35
2007-06-01 00:00:00, 2007-06-01 00:00:00, 2007 jun 1
```

## Array

An array is an indexed list of values (elements). Arrays can be associative what means that an element can not only be addressed by its index (number) but also by its key (string), if it has one. Single elements can be accessed by specifying the index or key surrounded by square brackets, '[' and ']' following the array value. The zero based index is created automatically and may change every time the array is modified. Keys are case insensitive, are assigned by statements and are valid until the associated array element is removed from the array. Elements in the same array can be of different types.
An array is assigned by specifying the elements between curly brackets, separated by a comma:

```
$b={ 'One'=>'1', 2, 3, 'Four'=>'4' }
```

Or by assigning a single element:
\$b ['Five']=5

The default for a nonexistent array element, is an Undefined value*. Use curly brackets or Array.Fill() to preset array elements to other types and values.

```
$arr={0}; $arr[0]+=1; $arr[0]+=2;
echo $arr,'<br>'
$arr={}.Fill(0,1); $arr[0]+=1; $arr[0]+=2;
echo $arr,'<br>'
```

Outputs:
$\left\{\begin{array}{l}3 \\ \{3\end{array}\right\}$
\{ 3 \}

| Operator | Description | Example | Result |
| :---: | :---: | :---: | :---: |
| $\begin{gathered} + \\ += \end{gathered}$ | Add one or more elements. | $\begin{aligned} & \$ a=\{1\}+\{2,3\} \\ & \$ a+=\{4,5\} \end{aligned}$ | $\begin{aligned} & \{1,2,3\} \\ & \{1,2,3,4,5\} \end{aligned}$ |
| -- | Remove one or more elements. If a key is given, the value is ignored. | $\begin{aligned} & \$ c=\$ a-\{2,5\} \\ & \$ b-=\{\text { 'One' }=>\text { "Don't care" }\} \end{aligned}$ | $\begin{aligned} & \{0=>1,1=>3,2=>4\} \\ & \left\{{ }^{\prime} \text { One', } 2,3, ' \text { Four' }=>'^{\prime} 4^{\prime}\right\} \end{aligned}$ |
| == | Is Equal to. <br> Two arrays are equal if they have the same number of elements and all values in the first array exists in the second array and vice-versa. The indices and/or keys and the order of the values are ignored. | $\begin{aligned} & \$ a==\left\{11^{\prime}\right\} \\ & \$ a=\{3,1,2\} \\ & \$ b=\{1,2,3\} \\ & \$ a==\$ b \end{aligned}$ | False <br> True |
| $!=$ | Is not equal to, reverse of ' $=$ a' $^{\prime}$ |  |  |
| 1 \| | Unless the left operant is Undefined, ignore the right operant, otherwise ignore the left operant. | $\begin{aligned} & \$ a=\left\{\left\{'^{\prime}, b^{\prime} b^{\prime}\right\}\right\} \\ & \$ d=\$ a[0]\| \|\left\{x^{\prime}, ' y^{\prime}\right\} \\ & \$ d=\$ a[2] \quad \mid \quad\left\{x^{\prime}, y^{\prime}\right\} \end{aligned}$ | $\begin{aligned} & \left\{' a '_{\prime}^{\prime} b^{\prime}\right\} \\ & \left\{x^{\prime}, y^{\prime}\right\} \end{aligned}$ |

| Member | Description | Example | Result |
| :---: | :---: | :---: | :---: |
| Avg () | The average of all the floats in the array | \{9,4, "xy", 8\}.Avg () | 7 |
| ClassName | The class name of the object |  |  |
| ContainsKey (key) | True if the array contains an element with key key |  |  |
| ContainsValue (value) | True if the array contains an element with value value |  |  |
| Count | Number of elements | $\begin{aligned} & \text { \$a=\{"abc",5,"xy"\}; } \\ & \$ a . \text { Count } \end{aligned}$ | 3 |
| Fill (value, count) | Fills the array with count (copies of) value. Existing elements are removed. | \$a.Fill (1,5).Count | 5 |
| First | First element | \{"abc",5,"xy"\}.First | "abc" |
| IndexOf (value) | Zero based index of the value in the array. If the array does not |  |  |

|  | contain the element, the result will be -1 . |  |  |
| :---: | :---: | :---: | :---: |
| GetUnique () | Returns a copy of the array minus the duplicate elements | $\begin{aligned} & \{\text { "abc", } 5, \text { "xy", } 5\} . \text { GetUni } \\ & \text { que() } \end{aligned}$ | \{"abc",5,"xy" |
| Join (sep) | Concatenate all the values to one string using sep as separator. | $\text { \{"abc",5,"xy"\}.Join(";" }$ | "abc;5;xy" |
| Keys | Array of all keys. For elements without a key, the index is returned. | ```{'One'=>'1','Two'=>'2', 7}.Keys``` | \{'One', 'Two', 2 \} |
| Last | Last element | \{"abc",5,"xy"\}.Last | "xy" |
| Max () | The largest of all floats in the array. | \{2,4, "xy", 8\}.Max() | 8 |
| Min () | The smallest of all floats in the array. | \{2, 4, "xy", 8 \}.Min() | 2 |
| Remove (value) | Removes any element from the array that has a value equal to value. The result is the array itself. |  |  |
| RemoveAt (index) | Removes the element at position index in the array. The result is the array itself. |  |  |
| RemoveByKey (key) | Removes the element that has the string key as key. The result is the array itself. |  |  |
| Reverse () | Reverses the order of elements in the array. The result is the array itself. |  |  |
| Sort () | Sorts the array by the values. The result is the array itself. | ```$a= {'a'=>2,'c'=>6,1,'g'=>8,'i'=>76,'h'=>5,0,5,'b'=>4} echo $a,'<br>'; { 'a'=>2, 'c'=>3, 1, 'g'=>8, 'i'=>76, 'h'=>5, 0, 5, 'b'=>4 } echo $a.Sort(),'<br>' { 0, 1, 'a'=>2, 'c'=>3, 'b'=>4, 5, 'h'=>5, 'g'=>8, 'i'=>76 } echo $a.SortByKey(),'<br>' { 0, 1, 5, 'a'=>2, 'b'=>4, 'c'=>3, 'g'=>8, 'h'=>5, 'i'=>76 } $a={'a'=>{'i'=>2,'j'=>8},'c'=>{'i'=>12,'j'=>18},1,'g'=>{'i'=> 9,'j'=>6},'i'=>{'i'=>4,'j'=>20},'h'=>5,'b'=>{'i'=>1,'j'=>12}} echo $a.Sort('i'),'<br>' { 1, 'a'=>'{ 'i'=>2, 'j'=>8 }', 'i'=>'{ 'i'=>4, 'j'=>20 }', 'h'=>5, 'c'=>'{ 'i'=>12, 'j'=>18 }' } echo $a.Sort('j'),'<br>' { 1, 'h'=>5, 'a'=>'{ 'i'=>2, 'j'=>8 }', 'c'=>'{ 'i'=>12, 'j'=>18 }', 'i'=>'{ 'i'=>4, 'j'=>20 }'}``` |  |
| Sort (subkey) | The array members are expected to be arrays too and the sorting is based on their values for subkey. If a member is not an array then its (single) value is used in the sort. |  |  |
| SortByKey () | Sorts the array by the keys. The result is the array itself. |  |  |
| Sum () | The sum of all floats in the array. | \{9,4,"xy", 8 \} . Sum () | 21 |
| Values | Array of all values. | $\begin{aligned} & \text { \{'One'=>'1', 'Two'=>'2', } \\ & \text { 7\}.Values } \end{aligned}$ | \{'1', '2', 7 \} |

In all versions before 2.16 a nonexistent array element returned an empty string. Backwards compatibility can be assured with the 'compatibility=emptyelement' application flag or with a 'System. SetCompatibility ('emptyelement', True)' call, see also the System object.
This behavior can also be mimicked using the '|l' (logical OR) operator. See the Variables section and the operator tables of the Array, String, Float or DateTime types.

## Bool

Bool is short for Boolean. A Boolean value can only have one of two values: it is either 'true' or 'false'.

| Operator | Description | Example | Result |
| :---: | :--- | :--- | :--- |
| $==$ | Is equal too | \$a=False; <br> \$a==True | False |
| $!=$ | Is not equal to | \$a!=False | True |
| $!$ | Logical NOT |  |  |
| $\& \&$ | Logical AND |  |  |
| $!\mid$ | Logical OR |  |  |

| (bool) ? expr1: expr2 | If bool equals True the result <br> of the whole expression will be <br> the result of expr1. Otherwise <br> it will be the result of expr2. <br> Note: Because the engine lacks <br> operator precedence you must <br> enclose the bool expression <br> with round brackets. | $\$ \mathrm{~S}=(\$ \mathrm{f}==4)$ ? "Yes" : "No" | "Yes" |
| :--- | :--- | :--- | :--- |

| Member | Description | Example | Result |
| :--- | :--- | :--- | :--- |
| ClassName | The class name of the object |  |  |

## DateTime

A DateTime is an object which contains a specific date and time and is used for date and time calculations. When converted to a float, the resulting float contains the number of seconds since the Gregorian date 0001-01-01 00:00:00. When converted to a string the string has the sortable format "YYYY-MM-DD hh:mm:ss".
A DateTime is assigned to a variable using a constructor
\$d=DateTime([expression])
Where expression is a float representing the number of seconds since the Gregorian date 0001-01-01 00:00:00 or a string containing a date in the sortable format "YYYY-MM-DD hh:mm:ss". If expression is omitted, DateTime() returns the current date and time.

| Operator | Description | Example | Result |
| :---: | :---: | :---: | :---: |
| $\begin{gathered} + \\ += \end{gathered}$ | Add a date or a number of seconds Note: Since the first date is '0001-0101 ', you must add 1 to the number of years, months or days you want to add when using the string format. | ```$d=DateTime(); $d2=$d+DateTime("0010-01-01"); $d2+=3600;``` | "2008-06-11 $16: 28: 38 "$ <br> $" 2017-06-11$ $16: 28: 38 "$ <br> $" 2017-06-11$ $17: 28: 38 "$ |
| $\begin{aligned} & - \\ & -= \end{aligned}$ | Subtract a date or a number of seconds. See ' + '. | \$d-=DateTime("12:00:00"); | "2008-06-11 04:28:38" |
| == | Is Equal to. | \$d. Date==DateTime("2008-06-11") | True |
| ! = | Is not equal to, reverse of ' $=$ =' | \$d!="2008-06-11" | True |
| 1 \| | Unless the left operant is Undefined, ignore the right operant, otherwise ignore the left operant. | $\begin{aligned} & \$ \mathrm{a}=\{\text { DateTime("2008-06-10") }\} \\ & \$ d=\$ a[0] \text { \|\| DateTime() } \\ & \$ d=\$ a[2] \text { \|\| DateTime() } \end{aligned}$ | $\begin{array}{ll} " 2008-06-10 & 00: 00: 00 " \\ " 2008-06-11 & 16: 28: 38 " \end{array}$ |

| Member | Description | Example | Result |
| :---: | :---: | :---: | :---: |
| DateTime() <br> DateTime (string) <br> DateTime (seconds) | The current date and time Casts the string to a date Casts the float seconds to a date |  |  |
| AddDays (days) | Adds a number of days to the date. |  |  |
| AddHours (hours) | Adds a number of hours to the date. |  |  |
| AddMinutes (minutes) | Adds a number of minutes to the date. |  |  |
| AddMonths (months) | Adds a number of months to the date. |  |  |
| AddSeconds (days) | Adds a number of seconds to the date. |  |  |
| AddYears(days) | Adds a number of years to the date. |  |  |
| ClassName | The class name of the object |  |  |
| Date | The date part | $\begin{aligned} & \text { \$d=DateTime (); } \\ & \text { \$dd=\$d. Date; } \end{aligned}$ | $\begin{aligned} & \text { "2008-06-11 } \\ & 16: 28: 38 " \\ & \text { "2008-06-11 } \\ & 00: 00: 00 " \end{aligned}$ |
| Day | The day of the month | \$dy=\$d. Day; | 11 |
| Format (format) | Formats the date to the given format. 'format' syntax is according to .Net DateTime object. | Echo <br> DateTime().Format ("yyyyMMdd <br> HHmmss"); | 20080611162838 |
| Hour | The hour of the day | \$h=\$d.Hour; | 16 |

| Minute | The minute of the hour | \$mi=\$d.Minute; | 28 |
| :--- | :--- | :--- | :--- |
| Month | The month of the year | \$mo=\$d.Month; | 6 |
| Second | The second of the minute | \$s=\$d.Second; | 38 |
| Time | The time part | \$t=\$d.Time; | "0001-01-01 <br> $16: 28: 38 "$ |
| TotalSeconds | The seconds passed since 0001-01-01 <br> $00: 00: 00$ | \$s=\$d.TotalSeconds; | 63348798518 |
| UTC | Convert to UTC Time | \$dd=\$d.UTC | "2008-06-11 <br> $14: 28: 38 " ~$ |
| UTCSeconds | The UTC equivalent in seconds since 1- <br> $1-1970 ~(U n i x ~ e p o c h) ~$ | \$utcsec=\$dd. UTCSeconds | 1213187318 |
| WeekDay | Day of the week based on Sunday as <br> day '0' | \$wd=\$d.WeekDay | 3 |
| Year | Year of the date | \$y=\$d.Year | 2008 |

## Float

A float represents a floating point numerical value and is the only numerical type the engine supports. All numerical values are converted to floats. When an integer is required, the float is rounded to the nearest integer. Hexadecimal numbers must be preceded by ' $0 x^{\prime}$, '0xff' equals ' 255 '. To output a Float in hexadecimal format use String(float," $x$ ").

| Operator | Description | Example | Result |
| :---: | :---: | :---: | :---: |
| + | Add | \$f=1+0.5 | 1.5 |
| += |  | \$ $\mathrm{f}+=1$ | 2.5 |
|  |  | \$f=5+"4"+3 | $48 \backslash \backslash=(5+443)$ |
|  |  | \$f="5"+4 | "54" |
| ++ | Increment by 1 | ++\$f | 11 |
| - | Subtract | \$f=20-2 | 18 |
| -= |  | \$f-=10 | 8 |
| -- | Decrement by 1 | --\$f | 7 |
| == | Is equal too | $1.5==2$ | False |
| ! = | Is not equal to | $1.5!=2$ | true |
| > | Greater than (case insensitive) | $10>4$ | true |
| < | Less than (case insensitive) | $10<4$ | false |
| >= | Greater than or equal to | $2>=2$ | true |
| <= | Less than or equal to | 10<=4 | false |
| * ${ }^{*}$ | Multiply | \$f=5*4 | 20 |
|  |  | \$ $\mathrm{E}^{*}=-3$ | -60 |
| $\begin{aligned} & 1= \\ & 1= \end{aligned}$ | Divide | \$ $\mathrm{f}=20 / 5$ | 4 |
|  |  | \$f/=2 | 2 |
| $\begin{aligned} & \hline \frac{\circ}{0} \\ & \% \\ & \hline \end{aligned}$ | Remainder (modulus) | \$f=20\% 7 | 6 |
|  |  | \$ f \% = 4 | 2 |
| $\begin{gathered} \hline \& \\ \&+ \\ \hline \end{gathered}$ | Binary AND | \$f=63\&0x11 | 17 |
|  |  | \$f\&=8 | 0 |
| \| $=$ | Binary OR | \$f=0x87\|14 | 143 |
|  |  | \$ f \| $=18$ | 159 |
| $\wedge^{\wedge}=$ | Binary exclusive OR (XOR) | \$f=15^7 | 8 |
|  |  | \$ $\mathrm{f}^{\wedge}=15$ | 7 |
| 11 | Unless the left operant is Undefined, ignore the right operant, otherwise ignore the left operant. | \$a $=\{12\}$ |  |
|  |  | \$d = \$a[0] \|| 5 | 12 |
|  |  | \$d = \$a[2] \|| 5 | 5 |

| Member | Description | Example | Result |
| :--- | :--- | :--- | :--- |
| Float (string) | Casts a string to a float |  |  |
| ClassName | The class name of the <br> object |  |  |
| Round ([decimals]) | Rounds the float to an <br> optional number of <br> decimals. <br> Default is no decimals. |  |  |
| String (format) | Converts the float to a <br> string using the specified <br> format string. |  |  |

## String

A string is the most common variable type since it normally contains readable text. Strings must be enclosed by single "" or double ""' quotations marks. Comparisons between strings are case insensitive. When using double quotes special characters can be escaped using the back slash ' ${ }^{\prime}$ ', i.e. \f (form feed), \n (new line), $\backslash r$ (carriage return), \t (tab), $\backslash \backslash$ (backslash), \" (double quote). When using single quotes, only the single quote character can be escaped.

| Operator | Description | Example | Result |
| :---: | :---: | :---: | :---: |
| $\begin{gathered} + \\ += \end{gathered}$ | Concatenate 2 strings | $\begin{aligned} & \$ s='^{\prime}+{ }^{\prime}+b^{\prime} \\ & \$ s={ }^{2} '^{\prime}+5 \\ & \$ s=4+' 5 ' \\ & \$ s+=' a ' \end{aligned}$ | $\begin{aligned} & \hline \text { "ab" } \\ & \text { "45" } \\ & 9 \\ & \text { "45a" } \end{aligned}$ |
| $\begin{aligned} & - \\ & -= \end{aligned}$ | Remove all occurrences of the second string from the first. | $\begin{aligned} & \text { \$s='Hello World'-'l' } \\ & \text { \$s-='o' } \end{aligned}$ | "Heo Word" <br> "He Wrd" |
| == | Is equal too | 'ab'=='ab' | True |
| ! = | Is not equal to | "ab"!="ba" | True |
| > | Greater than | "ac">"ab" | True |
| $<$ | Less than | "ac"<"ab" | False |
| >= | Greater than or equal to | "ab">="ab" | True |
| <= | Less than or equal to | "ac"<"ab" | False |
| $\begin{aligned} & * \\ & *= \\ & \text { * } \end{aligned}$ | Concatenate a string multiple times | $\begin{aligned} & \$ s="-" * 4 \\ & \$ s *=2 \end{aligned}$ | $\begin{aligned} & \hline \text { "----" } \\ & \text { "--------" } \end{aligned}$ |
| [index] | The character at position index. If index is negative, the position is relative to the end of the string. | $\begin{aligned} & \text { \$s="abcdef" } \\ & \text { \$s[3] } \\ & \text { \$s[-1] } \end{aligned}$ | $\begin{aligned} & \text { "d" } \\ & \text { "f" } \end{aligned}$ |
| 11 | Unless the left operant is Undefined, ignore the right operant, otherwise ignore the left operant. | $\begin{aligned} & \$ a=\{\text { "abcdef" }\} \\ & \$ d=\$ a[0] \text { \|\| "yxz" } \\ & \$ d=\$ a[2] \text { \|\| "yxz" } \end{aligned}$ | "abcdef" <br> "yxz" |

| Member | Description | Example | Result |
| :---: | :---: | :---: | :---: |
| ```String(value) String(value[,format])``` | Casts a value to a string Casts a value to a string using the specified format string. |  |  |
| ClassName | The class name of the object |  |  |
| IndexOf(string) | The zero based start position of the first occurrence of string | $\begin{aligned} & \text { \$s="Hello world"; } \\ & \text { \$s.IndexOf("l"); } \end{aligned}$ | 2 |
| LastIndexOf (string) | The start position of the last occurrence of string | \$s.LastIndexOf("l") | 9 |
| Length | The length | \$s.Length | 11 |
| Lower | The lower case version | \$s.Lower | "hello world" |
| MD5 | The MD5 hash of the string |  |  |
| ```Replace(string1, string2)``` | Replaces each occurrence of string1 with string2 | \$s.Replace("○", "0") | "Hell0 w0rld" |
| Split(string [,int]) | Split a string on separator string to an optional maximum of int | $\begin{aligned} & \text { \$s.Split("l") } \\ & \text { \$s.Split("l",2) } \end{aligned}$ | $\begin{aligned} & \{0=>' H e ', 1=>' ', \\ & 2=>' o w o r ', 3=>' d '\} \\ & \{0=>' H e ', 1=>' l o \\ & \text { world'\} } \end{aligned}$ |
| $\begin{aligned} & \text { Substring(int1 } \\ & \text { [, int2]) } \end{aligned}$ | The string part starting from int1 optionally with a maximum length of int2. If int1 is negative then the start is relative to the end of the string | $\begin{aligned} & \text { \$s.Substring (6) } \\ & \text { \$s.Substring }(6,2) \\ & \text { \$s.Substring }(-4,2) \end{aligned}$ | $\begin{aligned} & \text { "world" } \\ & \text { "wo" } \\ & \text { "or" } \end{aligned}$ |
| Trim() | Remove white spaces from beginning and end of string | " Hello\n".Trim() | "Hello" |
| Upper | The upper case version | \$s.Upper | "HELLO WORLD" |
| UrlDecode () | Decodes the URL encoded string | \$a="Hello <World>" echo \$a.UrlEncode() | Hello+\%3cWorld\%3e |
| UrlEncode | URL encodes the string | Echo <br> "Hello+\%3cWorld\%3e".Ur <br> lDecode() | Hello <World> |

## Keywords

$=$

```
<%= expression %>
```

The equals character ' $=$ ' is not really a keyword but an assignment operator. However, if it immediately follows the opening tag ' $<\%$ ', the result of expression is converted to a string and passed through to client.

| Example | Output |
| :--- | :--- |
| $<\%=" \mathrm{Hello}$ world" \%><br> <br> $<\% \$ a=5 \%><$ br $>$ <br> $<\%=\$ a \%><b r>$ | Hello world |

## Block, /Block

```
<% Block string %>
<% /Block %>
```

Defines a script part (block) with name string to be used (executed) later with Write. The part can contain anything except another block definition. Block and /Block must be enclosed with their own tags.
Blocks are stored in the array System.Blocks

| Example | Output |
| :---: | :---: |
| <\% Block "number" \%> | The number is 5 |
| The number is <\%=\$a\%><br> | The number is 3 |
| <\% /Block \%> |  |
| <\% |  |
| \$a=5; Write System.Blocks["number"]; |  |
| \$a=3; Write System.Blocks["number"]; |  |
| \%> |  |

## Echo

```
Echo string [, string] ...
```

Writes to output. The result of expression string is written to output. Multiple expressions can be written by separating them with a comma. This is faster than using the ' + ' operator and prevents unintentional type conversions

| Example | Output |
| :--- | :--- |
| $<\%$ | Hello world! |
| Echo "Hello world!" |  |
| $\gg$ |  |

## Exit

```
Exit [string]
```

Terminates the script immediately and optionally outputs the message string.

| Example | Output |
| :--- | :--- |
| $<\%$ Hello world |  |
| Echo "Hello world!" | He |

| Exit; <br> Echo "This is not shown" <br> $\%>$ |  |
| :--- | :--- |

## ForEach, [Continue], [Break], /ForEach

```
ForEach array
    Loop
/ForEach
```

ForEach is a loop statement. For each element in the array resulting from expression array, Loop is executed. Within Loop the execution of the current loop can be stopped by Break and Continue; the first will exit the ForEach statement and continue the script after / ForEach, while the latter will restart the loop with the next element, if there is one, from the array. Break and Continue are optional and can occur more than once within Loop.
Within Loop the index, key and value of the current element are copied to the variables \$_Index, \$_Key, resp. \$_Value.
ForEach constructs can be nested.

| Example | Output |
| :---: | :---: |
| <\% | \$a[0] = \{1=>One \} |
| \$a=\{'1'=>'One', '2'=>'Two','3'=>'Three','4'=>'Four'\} | \$a[2] $=$ \{3=>Three $\}$ |
| ForEach \$a |  |
| ```if $_Index==1 continue /If``` |  |
| \% $>$ |  |
| $\begin{aligned} & \text { \$a }\left[\left\langle \%=\$ \_ \text {Index } \%>\right]=\left\{\left\langle \%=\$ \_ \text {Key } \%>=><\%=\text { \$_Value } \%>\right\}\langle b r\rangle\right.\right. \\ & \langle \% \end{aligned}$ |  |
| ```if $ Value=='Three' break; /If``` |  |
| /Foreach <br> \%> |  |

## Format

Format name As format
Format gives a powerful method for outputting certain info in a consistent layout. Each time a value is written to output with $<\%=$ value $\%>$ and with Echo, it is formatted using the specified format. For formatting the rules of the C\# method String. Format () are used.

| Echo $" \$ \mathrm{~b}=", \$ \mathrm{~b}$, " $<\mathrm{br}>$ " <br> Echo $" \$ \mathrm{f}=\mathrm{"}, \$ \mathrm{f}$, "<br>" |  |
| :--- | :--- |
| $\%>$ |  |

## Function [Return], /Function

```
<% Function name([argument1, ...]) %>
    [Return [expression]]
<% /Function %>
```

Defines a script part (function) that can be called from anywhere in the script as a statement or as (part of) an expression. A function can contain anything except another function definition. Within a function other functions and the function itself (recursion) can be called. Function and/Function must be enclosed with their own tags. Use Return to exit a function and optionally pass a value to the calling expression. More than 1 Return statement can be used in the function body. Overloading is supported, which means you can define 2 or more functions with the same name as long as their number of arguments are different.
Variables within a function are always local; they are destroyed when the function exits. Also, variables outside the function are not accessible inside the function.

| Example | Output |
| :---: | :---: |
| <\% function Factorial (\$v1) \%> | $6!=720$ |
| <\% // Recursion example | $7+3=10$ |
| if \$v1==0 | $7+3+5=15$ |
| return 1 | $7 / 3=2.33333333333333$ |
| ```/if``` |  |
| \%> |  |
| <\% /function \%> |  |
| <\% function ShowFactorial (\$v1) \%> |  |
| <\% // No result, just output echo '6! = ',Factorial(6),'<br>' |  |
| \%> |  |
| <\% /function \%> |  |
| <\% |  |
| // Used as a statement ShowFactorial (\$v1) |  |
| \%> |  |
| <\% function Add (\$v1, \$v2) \%> |  |
| <\% // simple function return $\$ v 1+\$ \mathrm{v} 2$ |  |
| \%> |  |
| <\% /function \%> |  |
| <\% function Add (\$v1, \$v2, \$v3) \%> |  |
| <\% // overloading example return $\$ v 1+\$ v 2+\$ v 3$ |  |
| \% $>$ |  |
| <\% /function \%> |  |
| <\% function Devide (\$v1, \$v2) \%> |  |
| <\% // termination example |  |
| if (\$v2==0) |  |
| exit "Devision By zero!" |  |
| /if |  |
| return \$v1/\$v2 |  |
| \% $>$ |  |
| <\% /function \%> |  |
| <\% |  |
| echo $' 7+3=', \operatorname{Add}(7,3), \quad$ '<br>' echo ' $7+3+5=1, \operatorname{Add}(7,3,5), \quad$ '<br>' echo ' $7 / 3=1, \operatorname{Devide}(7,3), \quad$ '<br>' |  |
| \%> |  |

A function can also be used to add custom methods to existing classes by preceding the function name with the class name and a period '.'
When the function (i.e. method) is called, the subject (the object) of the method is accessible through the '\$this' variable.

| Example | Output |
| :---: | :---: |
| <\% function Array.Avg2 () \%> | The average is 5.5 |
| <\% // Custom method example. |  |
| // This is a simulation of |  |
| // the built-in Avg() method |  |
| \$ sum=0; |  |
| \$cnt=0; |  |
| foreach (\$this) |  |
| if \$_value.ClassName=="float" |  |
| \$sum+=\$_value |  |
| ++\$cnt |  |
| /if |  |
| /foreach |  |
| if \$cnt==0 |  |
| Return Null |  |
| /if |  |
| return \$sum/\$cnt |  |
| \% $>$ |  |
| <\% / function \%> |  |
| <\% |  |
| $\begin{aligned} & \$ a=\{1,2,3,4,5,6,7,8,9,10\} \\ & \text { echo "The average is ", \$a.Avg2(), '<br>' } \end{aligned}$ |  |
| \% $>$ |  |

## If, [Elself | Else If], [Else], /If

```
If bool1
    Part1
[ElseIf bool2
    Part2
...]
[Else
    Partx]
/If
```

'If' is a conditional statement. If expression bool1 results in True, then Part1 is executed, the rest is skipped up till the /If. If booll results in False then Part2 is executed only if bool2 results in True, the rest is skipped up till the /If. The ElseIf clause can be repeated as many times as you want and can also be written as Else If. If neither the If -expression and none of the ElseIf expressions were True, the Else clause Partx is executed. The ElseIf and Else clauses are optional. If's can be nested.

| Example | Output |
| :--- | :--- |
| $<\%$ | \$a is Three |
| \$a=3; \$b=1 | \$b is One |
| Echo "\$a is " |  |
| if \$a==2 |  |
| Echo "Two" |  |
| elseif \$a==3 |  |
| Echo "Three" |  |
| if \$b==1 |  |
| Echo " \$b is One" |  |
| /if |  |
| else |  |

| Echo "Some other value" |
| :--- | :--- |
| /if |
| $\%>$ |

## Include

include path
Include includes the file path into the current page. The code in the include file is processed as though it is part of the current page. This is especially useful for script parts like block and format definitions which are reused in several pages.

## While, [Continue], [Break], /While

```
While bool
    Loop
/While
```

While is like ForEach a loop statement, but instead of looping through a predetermined number of array elements it loops until the given Boolean expression bool, results in False. Within Loop the execution of the current loop can be stopped by Break and Continue; the first will exit the While statement and continue the script after /While, while the latter will restart the loop at the point of evaluating expression bool. Break and Continue are optional and can occur more than once within Loop.
While constructs can be nested.

| Example | Output |
| :---: | :---: |
| <\% | \$a[3] = \{Four\} |
| $\begin{aligned} & \$ a=\{' 1 '=>' O n e ', ' 2 '=>' T w o ', ~ ' 3 '=>' T h r e e ', ~ ' 4 '=>' F o u r '\} \\ & \$ i x=\$ a . C o u n t \end{aligned}$ | \$a[2] = \{Three \} |
| While \$ix>0 |  |
| --\$ix |  |
| ```if $ix==1 continue /If``` |  |
| \% $>$ |  |
|  |  |
| If $\$ \mathrm{a}[\$ \mathrm{ix}]==$ 'Three' |  |
| $\begin{aligned} & \text { break; } \\ & \text { /If } \end{aligned}$ |  |
| /While |  |
| \% ${ }^{\text {\% }}$ |  |

## With, /With

```
With context
/`With
```

Sets the current context to the result of the expression context. The context is the value to witch undetermined members are associated. This is especially useful when working with blocks. You can use the same block for objects that have the same member names as used within the block.

| Example | Output |
| :---: | :---: |
| <\% | 1 |
| \$a=\{'d'\} | 3 |
| $\$ b=\{' a ', ~ ' c ', ~ ' d '\}$ <br> With \$a |  |

| Echo .Count, "<br>" |  |
| :--- | :--- |
| /With |  |
| With \$b |  |
| Echo. Count, "<br>" |  |
| /With |  |
| $\%$ |  |

## Write

```
Write string [, string] ...
```

Writes to output. The difference with Echo, is that with Write the result of expression string is parsed by the engine as if it was a template file. This is why blocks should be written to output with Write and not with Echo.

| Example | Output |
| :--- | :--- |
| $<\%$ Block "number" \%> | The number is 5 |
| The number is $\langle \%=\$ \mathrm{a} \%><\mathrm{br}>$ | The number is |
| $<\% /$ Block \%> |  |
| $<\%$ |  |
| $\$ a=5 ;$ Write System. Blocks["number"]; <br> $\$ a=3 ;$ Echo System.Blocks["number"]; <br> $\%>$ |  |

## Engine objects

File
Static object for common file functions.

| Method | Description | Example | Result |
| :--- | :--- | :--- | :--- |
| AppendLine (path, <br> string) | Adds a line to the end of a file. CR and LF characters <br> are added. If the file does not exist, it is created. |  |  |
| CreatePath (path) | Creates all the directories in path. <br> Returns True if successful, Fal se otherwise. |  |  |
| Date (path) | Last modification date of a file |  |  |
| Delete (path) | Deletes a file or directory. <br> Returns True if successful, Fal se otherwise. <br> Note: If a directory is deleted all child directories <br> and files are delete too. |  |  |
| Exists (path) | Returns True if the file exists, False otherwise. |  |  |
| IsDirectory (path) | True if an existing directory |  |  |
| IsFile (path) | True if an existing file |  |  |
| Move (path, <br> destination) | Move or rename a file or directory. destination <br> must be the full path to the new name. If <br> destination exists, it is deleted first. <br> Returns True if successful, Fal se otherwise. |  |  |
| Read (path) | Reads the contents of a text file into an array; one <br> line per element. The CR and/or LF characters are <br> trimmed. |  |  |
| Size (path) | The length in bytes of a file |  |  |
| Write (path, <br> array) | Writes an array to a file. One line for each element. <br> CR and LF characters are added. |  |  |

## Http

Http is used to retrieve (remote) web pages or data.

| Method | Description | Example | Result |
| :--- | :--- | :--- | :--- |
| Get (url) | Returns the result of a HTTP-GET request to <br> url |  |  |
| Get (url, data) | Sends the array data as form data in a |  |  |

|  | HTTP-POST request to url and returns the <br> result. |  |  |
| :--- | :--- | :--- | :--- |
| DoRequest (url, method, <br> contenttype, data) | Sends an HTTP request to the url using given <br> http method and content type. |  |  |
| UrlEncode(data) | URL-encodes a string |  |  |
| UrlDecode(data) | Decodes an URL-encoded string |  |  |

## Math

Math is a static object is has no value, only members and is used for mathematical calculations.

| Method | Description | Example | Result |
| :---: | :---: | :---: | :---: |
| Abs (float) | The absolute value of float | \$d=Math.Abs (-5); | 5 |
| Ceil (float) | The smallest integer greater than or equal to float | $\begin{aligned} & \text { Math.Ceil (-5.3) } \\ & \text { Math.Ceil(5.3) } \end{aligned}$ | $\begin{aligned} & \hline-5 \\ & 6 \end{aligned}$ |
| E | The natural logarithmic base e |  |  |
| Floor (float) | The largest integer less than or equal to float | $\begin{aligned} & \text { Math.Ceil (-5.3) } \\ & \text { Math.Ceil(5.3) } \end{aligned}$ | $\begin{aligned} & -5 \\ & 6 \end{aligned}$ |
| $\begin{aligned} & \text { Max(float1, } \\ & \text { float2) } \end{aligned}$ | The larger of 2 values |  |  |
| $\begin{aligned} & \text { Min(float1, } \\ & \text { float2) } \end{aligned}$ | The smaller of 2 values |  |  |
| Pi | The ratio of the circumference of a circle to its diameter: $\pi$. |  |  |
| $\begin{aligned} & \text { Pow(float1, } \\ & \text { float2) } \end{aligned}$ | The power of float1 to float2 |  |  |
| Round (float) | The rounded value of float |  |  |
| Sign | The signing of a number: <br> -1: float <0 <br> 0: float==0 <br> 1: float>0 |  |  |

## RegEx

## RegEx enables the use of regular expressions.

| Method | Description | Example | Result |
| :--- | :--- | :--- | :--- |
| Match (expr, subject) | Matches the regular expression expr <br> on the string subject and returns <br> the first match as an array. The first <br> element contains the full match, the <br> following elements contain the sub <br> matches, if there were any. |  |  |
| Matches (expr, subject) | Similar to Match (), but returns all the <br> matches. |  |  |

## Request

## Request gives access to the HTTP request information.

| Method | Description | Example | Result |
| :--- | :--- | :--- | :--- |
| Base | Base url of the request | Request.Base | 'http://localhost:8080' |
| Cookies | Array of client cookies |  |  |
| Get | Array of values from the query string |  |  |
| Headers | Array of the HTTP headers of the request | Request. Headers [ <br> 'host'] | 'localhost:8080' $^{\text {Post }}$ |
| Array of form values from the POST data. <br> Currently only content type ' <br> application/x-www-form- <br> urlencoded' is supported. |  |  |  |
| Query | Full query string of the request | Request.Query | '?cmd=test' |
| RawPost | String with the raw POST data. |  |  |
| SendCookie (name, <br> value) | Add or replace a cookie to/in the response |  |  |
| SendHeader (name, | Add an HTTP header to the response |  |  |

| value) |  |  |  |
| :--- | :--- | :--- | :--- |
| Session | Non volatile array that can be used to pass data <br> between requests of the same client (session). <br> Sessions expire when Source terminates |  |  |
| Url | Url of the request | Request. Url | 'http://localhost:8080/test. <br> html |
| User | Authenticated user name | Request.User | 'admin' $^{\prime}$ |

## System

System is the main object of the template engine.

| Method | Description | Example | Result |
| :---: | :---: | :---: | :---: |
| Blocks | Array of all the defined blocks | See Write |  |
| $\begin{aligned} & \text { Compatibility(st } \\ & \text { ring) } \end{aligned}$ | Returns the value of a compatibility flag. <br> Flags can be: <br> - 'EmptyElement': nonexisting array elements return an empty String instead of a Undefined. |  |  |
| SetCompatibility(strin g, bool) | Set or clear a compatibility flag |  |  |
| DataFolder | Local path to the application data folder | System. DataFolder | C: \Documents and Settings $\backslash$ me $\backslash$ Application Data |
| Date | String with current local date | System. Date | 16-06-2008 |
| EnvVars | Array of the systems environment variables |  |  |
| Execute ( program, [arguments, [directory]]) | Starts a program on the computer where Source is running. <br> Note: If you a start a program that requires administrator rights, the computer locks up with a message box, that requires user interaction. | System.Execute( <br> "cmd.exe", <br> "/c \a") | Sounds a beep. |
| LanAdapters | Array with info about the networks adapters of the PC | System.LanAdapters[0] | ```\'MACAddress'=>'00:1d:09:42:10: 47', 'IP6Address'=> fe:80:00:00:00:00:00:00:ad:bc :15:14:cc:3c:12:f3', 'IPAddress'=>'10.0.2.138', 'IPMask'=>'255.255.255.0', 'Gateway'=>'10.0.2.254', 'Name'=>'LAN-verbinding', 'Description'=>'Broadcom NetXtreme 57xx Gigabit Controller', 'Type'=>'Ethernet' }``` |
| Path | Local path to the server root folder |  | C: \Program <br> Files $\backslash$ Plugwise $\backslash$ Plugwise Source\www |
| Settings | Array with all the name-value pairs as specified in the ini file under the [Settings] category. |  |  |
| TempFolder | Path to the temporary files folder | System.TempFolder | C: \Documents and Settings $\backslash m e \backslash$ Local Settings $\backslash$ Temp |
| Time | String with current local time | System.Time | 21:37:33 |
| Version | Version string of the engine | System.Version | 2.1 |

## Plugwise Objects

Note: An asterix (**') in the first column means that that functionality is only available in the Pro version.

## Plugwise

The Plugwise object is the root object of all the Plugwise system objects.

|  | Method | Description | Example | Result |
| :--- | :--- | :--- | :--- | :--- |
|  | Appliances | Array of all the appliances with their Id as <br> key. |  |  |
| $*$ | Backup (path) | Saves a backup of the current database to <br> the specified path. |  |  |
|  | ClassName | The class name of the object |  |  |
|  | ColorScheme | Returns the current color scheme for |  |  |

|  |  | graphs or the default if none is set. |  |  |
| :---: | :---: | :---: | :---: | :---: |
|  | SetColorScheme (array) | Sets the color scheme for graphs. Array does not need to contain all colors, just the ones you want to change from the default. <br> Use Null to reset to default. | Plugwise.SetColorScheme ( <br> \{"background" $=>0 \mathrm{x} 004000$ )Plugwise.SetColorScheme (Null) |  |
| * | CreateAppliance ( $n a m e)$ | Creates a new appliance |  |  |
| * | CreateGroup ( name ) | Creates a new group |  |  |
| * | CreateModule(name) | Creates a new module |  |  |
| * | CreateNetwork (name) | Creates a new network |  |  |
| * | CreateRoom (name) | Creates a new room |  |  |
| * | CreateSchedule ( name) | Creates a new schedule |  |  |
| * | CreateTariff(name) | Creates a new tariff |  |  |
|  | Currency | The used currency symbol in Source | Echo Plugwise.Currency | $\epsilon$ |
|  | DayCodes | Array of the short week day codes, used for schedules. | Echo Plugwise. DayCodes |  |
|  | FeatureFlags | The licensed features of Source | Echo <br> Plugwise.FeatureFlags | \{'W', 'X'\} |
|  | Groups | Array of all the groups with their Id as key. |  |  |
|  | ImagesPath | Virtual path to dynamic images | ```<img src="<%=Plugwise.Image sPath%>32/<%=.ImageNam e%>.png">``` | $\begin{aligned} & \text { <img } \\ & \text { src="/pwimg/ } \\ & 32 / \text { appliance } \\ & \text {.png"> } \end{aligned}$ |
|  | Language | Current language code of application | Echo Plugwise.Language | N1 |
| * | LanAdapters | Array of all the active LAN adapters of the system |  |  |
|  | License | The product license string |  |  |
| * | Logdata (array, startdate [, enddate [, tarifftype ]]) | Returns an array with the log data of type tarifftype of the appliances in array for the specified date or period. tarifftype can be 1 for usage or 257 for production. Default is 1 |  |  |
| * | SetLicense (string) | Sets the license with the given key. No other license may be active and the given key must be valid. <br> Result: True if the new license is valid. | SetPersonalInfo(\{ <br> 'FirstName'=> 'Fred', <br> 'LastName'=>'Flintstone' \}) |  |
|  | Modules | Array of all the modules with their Id as key. |  |  |
|  | Networks | Array of all the networks with their Id as key. |  |  |
|  | PersonalInfo | Array of all personal info settings |  |  |
| * | SetPersonalInfo(array) |  | $\begin{aligned} & \text { SetPersonalInfo(\{ } \\ & \text { 'FirstName'=> 'Fred', } \\ & \text { 'LastName'=>'Flintstone' \}) } \end{aligned}$ |  |
| * | Register() | Registers current license, personal info and modules at Plugwise server. |  |  |
|  | Restart() | Registers current license, personal info and modules at Plugwise server. |  |  |
|  | Rooms | Array of all the rooms with their Id as key. |  |  |
|  | ScanPorts([array]) | Scan the given ports for Plugwise Stick. If no array is given, all COM ports are scanned. <br> Result: array of found Networks. |  |  |
|  | Schedules | Array of all the schedules with their Id as key. |  |  |
|  | Tariffs | Array of all the tariffs with their Id as key. |  |  |
|  | Version | Application version of Source |  |  |

## Appliance

The Appliance object is the representation of the 'Appliance' entity in the application. All returned information is 'last known', not necessarily 'current'. This prevents page delays as a result of slow communication or offline modules.
An existing appliance object can be obtained in 3 different ways
\$app = Appliance(name)
\$app = Appliance(id)
\$app = Plugwise.Appliances[index]

## A new appliance object can be created by

\$app = Plugwise.CreateAppliance (name)

## and deleted with

Plugwise. DeleteAppliance (appliance)

|  | Method | Description | Example | Result |
| :---: | :---: | :---: | :---: | :---: |
|  | ClassName | The class name of the object |  |  |
|  | DoNotSwitchOff | True if the appliance is flagged not to switch off. |  |  |
|  | SetDoNotSwitchoff (bool) |  |  |  |
|  | FirstSeenDate | First moment the module was online after it was attached to the appliance. This is also the start point for logging of the appliance. |  |  |
| * | SetFirstSeenDate (dateTime) |  |  |  |
| * | GetExtra(name, default) | Retrieve custom info name for this object from database or use default if name is not set. |  |  |
| * | SetExtra(name, value) |  |  |  |
|  | Id | Internal ID of the appliance |  |  |
|  | IsOff | True if the (module of the) appliance is switched off. |  |  |
|  | IsOn | True if the (module of the) appliance is switched on. |  |  |
|  | IsOnline | True if the (module of the) appliance is online. |  |  |
|  | ImageName | Name of the virtual image file |  |  |
|  | LastSeenDate | Timestamp of last contact |  |  |
|  | LastSeenSeconds | Seconds past since last contact |  |  |
| * | Log(startdate [, enddate [, tarifftype ]]) | Returns the log data of type tarifftype of the appliance for the specified date or period. tarifftype can be 1 for usage or 257 for production. |  |  |
|  | Module | Module to which the appliance is attached |  |  |
|  | Name | Name of the appliance |  |  |
|  | SetName (string) |  |  |  |
|  | NotInNetwork | True if the appliance is (temporarily) not part of the network and should be ignored. |  |  |
|  | SetNotInNetwork (bool) |  |  |  |
|  | PowerState | Power state of the appliance: 'on' or 'off' |  |  |
|  | PowerUsage | Last known power usage |  |  |
|  | Schedule | Assigned schedule or Null |  |  |
| * | SetSchedule(schedule) | Assign a schedule or Null to unassign. |  |  |
|  | SkipInTotals | Ignore this appliances when summarizing usage, totals etc for lists of appliances. For instance with Group.TotalUsage. |  |  |
|  | SetSkipInTotals(bool) |  |  |  |
|  | StatusImageName | Name of the virtual image that includes the status | ```<img src="<%=Plugw ise.ImagesPat h%>32/<%=.Sta tusImageName% >.png">``` | ```<img src="/pwimg/ 32/appliance _on.png">``` |
|  | SwitchOff() | Switch the (module of the) appliance off |  |  |
|  | SwitchOn() | Switch the (module of the) appliance on |  |  |
|  | TotalUsage | Total power usage since the last counter reset. Setting this value by script will not reset the TotalUsageStartDate |  |  |
|  | SetTotalUsage (float) |  |  |  |
|  | TotalUsageStartDate | Date from witch on TotalUsage is calculated. |  |  |
|  | SetTotalUsageStartDate(date) |  |  |  |
|  | TotalUsageToday | Total power usage for today |  |  |
|  | Type | Appliance type |  |  |

|  | SetType (string) |  |  |  |
| :--- | :--- | :--- | :--- | :--- |
|  | TypeText | Appliance type translated to the current <br> language |  |  |
|  | UUId | Universally Unique IDentifier |  |  |

## Group

The Group object is the representation of the 'Group' entity in the application.
An existing group object can be obtained in 3 different ways

```
\$grp \(=\) Group (name)
\$grp \(=\) Group (id)
\$grp \(=\) Plugwise.Groups[index]
```

## A new group object can be created by

\$grp $=$ Plugwise.CreateGroup (name)

## and deleted with

Plugwise. DeleteGroup (group)

|  | Method | Description | Example | Result |
| :---: | :---: | :---: | :---: | :---: |
| * | Add (appliance) | Adds appliance to the group |  |  |
|  | Appliances | Array of appliances which are member of the group |  |  |
|  | BroadcastMacAddress | The virtual MAC Address of the groups used for broadcasts. Can be empty; no broadcasts used. |  |  |
|  | SetUseBroadcast (bool) | Use broadcasts for switching all appliances in the group or not. |  |  |
|  | ClassName | The class name of the object |  |  |
| * | GetExtra(name, default) | Retrieve custom info name for this object from database or use default if name is not set. |  |  |
| * | SetExtra(name, value) |  |  |  |
|  | Hidden | True If the group is not visible in any screen except the Groups screen. |  |  |
|  | SetHidden (bool) |  |  |  |
|  | Id | Internal ID of the group |  |  |
| * | Log(startdate [, enddate [, tarifftype ]]) | Returns the log data of type tarifftype of the group's appliances for the specified date or period. tarifftype can be 1 for usage or 257 for production. |  |  |
|  | Name | Name of the group |  |  |
|  | SetName(string) |  |  |  |
|  | PowerState | Off if all the modules attached to the room's appliances that are online and do not have the NotInNetwork flag are switched off. Otherwise On |  |  |
|  | PowerUsage | Total of the group's appliances last known power usage. <br> Note: Appliances with SkipInTotals flag set are ignored. Unless all appliances of the group have this flags set, then the flag is ignored. |  |  |
| * | Remove (appliance) | Removes appliance from the group |  |  |
|  | Schedule | Assigned schedule or Null |  |  |
| * | SendSchedules () | For each assigned appliance send its schedules or disable if it has none. |  |  |
| * | SetSchedule(schedule) | Assign a schedule or Null to unassign. |  |  |
|  | SwitchOn() | Switch on the (modules of the) appliances assigned to the group |  |  |
|  | SwitchOff() | Switch off the (module of the) appliances assigned to the group |  |  |
|  | TotalUsage | Total power all the appliances usage since their last counter reset. <br> Note: Appliances with SkipInTotals flag set are ignored. Unless all appliances of the group have this flags set, then the flag is ignored. |  |  |
|  | TotalUsageToday | Total power all the appliances usage for today. Note: Appliances with skipInTotals flag set are ignored. Unless all appliances of the group have this flags set, then the flag is ignored. |  |  |
|  | Type | Type of the group |  |  |

| $*$ | SetType (typename) | Set the type of the group: possible values are 'report', <br> 'application' and 'switching'. <br> Note: If type is 'report' the Hidden flag is set to False. <br> For other values it is set to True. |  |  |
| :--- | :--- | :--- | :--- | :--- |
|  | TypeText | Translated name for type of the group |  |  |
|  | UUId | Universally Unique IDentifier |  |  |

## Module

The Module object is the representation of the 'Module' or 'Plug' entity in the application. All returned information is 'last known', not necessarily 'current'. This prevents page delays as a result of slow communication or offline modules. Exceptions are closerelay (), openRelay() and Getpowerusage(). They will wait until a valid answer is received or the given timeout has expired.
An existing module object can be obtained in 3 different ways

```
$mod = Module(name)
$mod = Module(macaddress)
$mod = Module(id)
$mod = Plugwise.Modules[index]
```

A new module object can be created by
\$mod = Plugwise.CreateModule (macaddress)

## and deleted with

Plugwise. DeleteModule (module)

|  | Method | Description | Example | Result |
| :---: | :---: | :---: | :---: | :---: |
|  | Appliance | The assigned appliance |  |  |
| * | Add (appliance) | Attaches the module to the appliance. A module can only be attached to 1 module and vice versa. |  |  |
|  | ClassName | Class name of the object |  |  |
|  | CloseRelay(timeout, retries) | Close the relay; switch on the connected appliance. The result is True if the module did close the relay. <br> Note: The maximum possible 'hang time' for the command is timeout * (retries +1 ) seconds. | ```<% $modid=Request.Get["modid"] $mod=Plugwise.Modules[$modid] if $mod.IsOpen $res= $mod.CloseRelay(4,0) else $res= $mod.OpenRelay(4,0) /if if $res echo "Module switched to: ",$mod.RelayState,"<br>" else echo "Module switching failed!<br>" /if %>``` |  |
|  | FirmwareDate | Timestamp of firmware. |  |  |
|  | FirmwareVersion | Version string of firmware |  |  |
|  | FirstSeenDate | Timestamp of first contact. |  |  |
| * | SetFirstSeenDate (dateTime) |  |  |  |
|  | FirstSeenLogIndex | Current internal logging index of the module at the time of FirstSeenDate |  |  |
| * | SetFirstSeenLogIndex (int) |  |  |  |
| * | GetExtra (name, default) | Retrieve custom info name for this object from database or use default if name is not set. |  |  |
| * | SetExtra(name, value) |  |  |  |
| * | GetInfo(timeout, retries) | Requests the node info from the module. The result is True if the module did return the node info usage or. The new info is used to update the module's properties. |  |  |

|  | GetPowerUsage (timeout, retries) | Requests the current measured power usage of the module. The result is True if the module did return the usage or if a power usage request is pending, because the relay just closed. The new value is stored in PowerUsage. |  |  |
| :---: | :---: | :---: | :---: | :---: |
|  | HardwareVersion | Version string of hardware |  |  |
|  | Humidity | Sense: Last reported humidity |  |  |
|  | Id | Internal ID of the module |  |  |
|  | IsClosed | True if the relay of module is closed (power is on). |  |  |
|  | IsOnline | True if the module is online. |  |  |
|  | IsOpen | True if the relay of module is open (power is off). |  |  |
|  | ImageName | Name of the virtual image file |  |  |
|  | LastCompletedLogIndex | Oldest internal logging index of the module of which all data is retrieved and processed. |  |  |
| * | SetlastCompletedLogIndex (int) |  |  |  |
|  | LastSeenDate | Timestamp of last contact |  |  |
|  | LastSeenSeconds | Seconds past since last contact |  |  |
|  | LastTelegram | If the module is a P0 or P1 reader, this is the last received telegram from the meter |  |  |
|  | MacAddress | MAC address (hardware address) of the module. |  |  |
|  | Name | Name of the module |  |  |
|  | SetName (string) |  |  |  |
|  | Network | Network the module is member off. |  |  |
|  | OpenRelay(timeout, retries) | Open the relay; switch off the connected appliance. The result is True if the module did open the relay. | See CloseRelay() |  |
|  | PowerUsage | Last known power usage |  |  |
|  | RelayState | Switch state of the relay: 'open' or 'closed' |  |  |
| * | Remove (appliance) | Detaches the appliance from the module. |  |  |
|  | Status | Status of the module: 'online', 'offline' of 'unknown' |  |  |
|  | StatusImageName | Name of the virtual image that includes the status | ```<img src="<%=Plugwise.Imag esPath%>32/<%=.Status ImageName%>.png">``` | $\begin{aligned} & \text { <img } \\ & \text { src="/pwimg/32/app } \\ & \text { liance_on.png"> } \end{aligned}$ |
|  | Type | Module type |  |  |
| * | SetType (type) |  |  |  |
|  | Temperature | Sense: Last reported temperature |  |  |
|  | TypeText | Module type translated to the current language |  |  |
|  | UUId | Universally Unique IDentifier |  |  |

## Network

The Network object is the representation of the 'Network entity in the application. Normally the Network entity is only shown when the application controls more than 1 network. An existing network object can be obtained in 3 different ways

```
$netw = Network(name)
$netw = Network(macaddress)
$netw = Network(id)
$netw = Plugwise.Networks[index]
```

## A new network object can be created by

\$netw = Plugwise.CreateNetwork(macaddress)

## and deleted with

Plugwise. DeleteNetwork(network)

|  | Method | Description | Example | Result |
| :---: | :---: | :---: | :---: | :---: |
| * | Add (module) | Assigns the module to the network. A module can only be assigned to 1 network. |  |  |
|  | ClassName | Class name of the object |  |  |
| * | ExpectedOnlineCount | Number of modules that should be online excluding SEDs and those that are flagged 'NotInNetwork'. |  |  |
| * | GetExtra(name, default) | Retrieve custom info name for this object from database or use default if name is not set. |  |  |
| * | SetExtra(name, value) |  |  |  |
| * | GetModuleList () | Returns a list of modules known to the NC. <br> Note: This action blocks the webserver for at least 30 seconds. |  |  |
|  | Id | Internal ID of the module |  |  |
|  | ImageName | Name of the virtual image file |  |  |
|  | MacAddress | MAC address (hardware address) of the module. |  |  |
|  | MC | The Stick module of the network |  |  |
|  | Modules | Array of modules which are assigned to the network |  |  |
|  | Name | Name of the network |  |  |
|  | SetName (string) |  |  |  |
|  | NC | The Circle+ module of the network |  |  |
| * | OnlineCount | Number of online modules excluding SEDs and those that are flagged 'NotInNetwork'. |  |  |
|  | PowerUsage | Total of last known power usage of all modules. |  |  |
| * | Quality | Percentage of online modules excluding SEDs and those that are flagged 'NotInNetwork'. |  |  |
| * | Remove (appliance) | Detaches the appliance from the module. |  |  |
|  | Schedule | Assigned schedule or Null |  |  |
|  | Status | Status of the network: 'online', 'offline' |  |  |
|  | Status ImageName | Name of the virtual image that includes the status | ```<img src="<%=Plugwise.Images Path%>32/<%=.StatusImag eName%>.png">``` | $\begin{aligned} & \text { <img } \\ & \text { src="/pwimg/32/app } \\ & \text { liance_on.png"> } \end{aligned}$ |
|  | SwitchOn() | Switch on the all modules in the network |  |  |
|  | SwitchOff() | Switch off the all modules in the network |  |  |
|  | UUId | Universally Unique IDentifier |  |  |

## Room

The Room object is the representation of the 'Room' entity in the application.
A new room object can be created with
\$room = Plugwise.CreateRoom (name)

## An existing room object can be obtained in 3 different ways

\$room = Room (name)
\$room $=$ Room(id)
\$room = Plugwise.Rooms[index]

## and deleted with

Plugwise. DeleteRoom (room)

|  | Method | Description | Example | Result |
| :--- | :--- | :--- | :--- | :--- |
|  | Appliances | Array of appliances which are assigned to the room |  |  |
| $*$ | Add (appliance) | Assigns the appliance to the room |  |  |
|  | ClassName | The class name of the object |  |  |

| * | GetExtra(name, default) | Retrieve custom info name for this object from database or use default if name is not set. |  |  |
| :---: | :---: | :---: | :---: | :---: |
| * | SetExtra(name, value) |  |  |  |
|  | Id | Internal ID of the room |  |  |
| * | ```Log(startdate [, enddate [, tarifftype ] ])``` | Returns the log data of type tarifftype of the room's appliances for the specified date or period. tarifftype can be 1 for usage or 257 for production. |  |  |
|  | Name | Name of the room |  |  |
|  | SetName (string) |  |  |  |
|  | PowerState | Off if all the modules attached to the room's appliances that are online and do not have the NotInNetwork flag are switched off. Otherwise On |  |  |
|  | PowerUsage | Total of the appliances last known power usage. <br> Note: Appliances with skipInTotals flag set are ignored. Unless all appliances of the room have this flags set, then the flag is ignored. |  |  |
| * | Remove (appliance) | Removes appliance from the room |  |  |
| * | SendSchedules () | For each assigned appliance send its schedules or disable if it has none. |  |  |
|  | SwitchOn() | Switch on the (modules of the) appliances assigned to the room |  |  |
|  | SwitchOff() | Switch off the (module of the) appliances assigned to the room |  |  |
|  | TotalUsage | Total power all the appliances usage since their last counter reset. <br> Note: Appliances with SkipInTotals flag set are ignored. Unless all appliances of the room have this flags set, then the flag is ignored. |  |  |
|  | TotalUsageToday | Total power all the appliances usage for today. <br> Note: Appliances with skipInTotals flag set are ignored. Unless all appliances of the room have this flags set, then the flag is ignored. |  |  |
|  | TemperatureAndHumidity | Array with last reported temperature and humidity or the average if more than one Sense are linked to the room. |  |  |
|  | Type | Room type id |  |  |
|  | SetType(string) | Room type id |  |  |
|  | TypeText | Room type translated to the current language |  |  |
|  | UUId | Universally Unique IDentifier |  |  |

## Schedule

The Schedule object is the representation of the 'Switching schedule' entity in the application.
A new schedule object can be created with
\$sched $=$ Plugwise.CreateSchedule (name)

## An existing schedule object can be obtained in 3 different ways

\$sched $=$ Schedule (name)
\$sched = Schedule (id)
\$sched $=$ Plugwise.Schedules[index]
and deleted with
Plugwise. DeleteSchedule(schedule)

|  | Method | Description | Example | Result |
| :---: | :---: | :---: | :---: | :---: |
|  | Appliances | Array of appliances to which the schedule has been assigned directly. |  |  |
| * | GetExtra(name, default) | Retrieve custom info name for this object from database or use default if name is not set. |  |  |
| * | SetExtra(name, value) |  |  |  |
|  | AssignedAppliances | Array of appliances to which the schedule has been assigned directly or indirectly via a group or room. |  |  |
|  | Groups | Array of groups to which the schedule has been assigned. |  |  |

|  | Name | Name of the group |  |  |
| :--- | :--- | :--- | :--- | :--- |
|  | SetName (string) | Name of the group |  |  |
| $*$ | Send () | Sends the schedule to the (modules of) the assigned <br> appliances. The method returns immediately, the <br> sending is done in the background. <br> The result value is the number of modules affected by <br> the new schedule. |  |  |
|  | Status ImageName | Name of the virtual image that includes the status |  |  |
|  | Values | Array of 7 arrays (days) with 96 values (4 quarters *24 <br> hours). -1 means 'On', 0 means ' Off', any positive <br> value represents the standby value. <br> The keys of the 7 arrays are "mo","tu", "we", "th", <br> "fr", "sa", "su" and are available via <br> Plugwise. DayCodes |  |  |
| $*$ | SetValues (array) | Universally Unique IDentifier |  |  |
|  | UUId |  |  |  |

## Tariff

The Tariff object is the representation of the 'Tariff' entity in the application.
A new tariff object can be created with
\$tar = Plugwise.CreateTariff(name)

## An existing tariff object can be obtained in 4 different ways

```
$tar = Tariff(name)
$tar = Tariff(id)
$tar = Tariff(Date[,type])
$tar = Plugwise.Tariffs[index]
```

and deleted with
Plugwise. DeleteTariff(tariff)

|  | Method | Description | Example | Result |
| :---: | :---: | :---: | :---: | :---: |
|  | ClassName | The class name of the object |  |  |
|  | CO2Emission | $\mathrm{CO}_{2}$ emission in kg per kWh |  |  |
| * | SetCO2Emission(float) |  |  |  |
|  | CompanyName | Company name property |  |  |
|  | SetCompanyName (string) |  |  |  |
|  | EndDate | End date of the tariff period |  |  |
| * | SetEndDate (date) |  |  |  |
| * | GetExtra(name, default) | Retrieve custom info name for this object from database or use default if name is not set. |  |  |
| * | SetExtra(name, value) |  |  |  |
|  | HasPeakTariff | Tariff has a split tariff structure |  |  |
|  | Id | Internal ID of the tariff |  |  |
|  | IsPeakTime (date) | True if the peak tariff should be used for the given timestamp. date must be between with the tariff's start and end date. |  |  |
|  | IsProducing | True if the tariff is for producing energy (Type $>=256$ ) |  |  |
|  | Name | Name of the tariff |  |  |
|  | SetName (string) |  |  |  |
|  | PeakDays | Array of 2 letter day of week codes on which the peak tariff should be used. |  |  |
| * | SetPeakDays (array) |  |  |  |
|  | PeakEndHour | Last hour of the daily peak period, 0 to 23 |  |  |
| * | SetPeakEndHour (hour) |  |  |  |
|  | PeakStartHour | First hour of the daily peak period, 0 to 23 -1 means no peak period |  |  |
| * | SetPeakStartHour (hour) |  |  |  |
|  | PeakTariff | kWh rate during peak time |  |  |
| * | SetPeakTariff(float) |  |  |  |
|  | ProductName | Product name |  |  |
| * | SetProductName (string) |  |  |  |

|  | StartDate | Start date of the tariff period |  |  |
| :---: | :--- | :--- | :--- | :--- |
| $\star$ | SetStartDate (date) |  |  |  |
|  | Tariff | kWh rate for normal or off-peak time |  |  |
| $\star$ | SetTariff(float) |  |  |  |
|  | Type | tariff type id |  |  |
| $\star$ | SetType (int) |  |  |  |
|  | TypeText | Tariff type translated to the current language |  |  |
|  | UUId | Universally Unique IDentifier |  |  |

## Trigger

The Trigger object is the representation of the 'Trigger' entity in the application. It is linked to an event of a module like pressing a Switch button or detecting movement by a Scan.
A new trigger object cannot be created via PTE. It is automatically created for the corresponding Switch, Sense or Scan when fired (button pressed, movement detected etc.).

## An trigger object can be obtained in 3 different ways

\$tgr = Trigger (name)
\$tgr = Trigger(id)
\$tgr = Plugwise.Triggers[index]

|  | Method | Description | Example | Result |
| :--- | :--- | :--- | :--- | :--- |
|  | ClassName | The class name of the object |  |  |
|  | Group | The group to which the trigger is linked, if any |  |  |
| $\star$ | GetExtra (name, <br> default) | Retrieve custom info name for this object from <br> database or use default if name is not set. |  |  |
| $\star$ | SetExtra (name, value) |  |  |  |
|  | SetGroup (string) |  |  |  |
|  | Id | Internal ID of the trigger |  |  |
|  | Module | The module to which the trigger belongs to |  |  |
|  | Name | Name of the trigger |  |  |
|  | SetName (string) | Trigger type id (same as the module type) |  |  |
|  | Type | Trigger type translated to the current language |  |  |
|  | TypeText | Universally Unique IDentifier |  |  |
|  | UUId |  |  |  |
|  |  |  |  |  |

## Built-in icons

The built icons in Source can be accessed via the url/pwimg/size/name.png as transparent PNG images. In a script you can use Plugwise.ImagesPath as the base path. The 'size' parameter is the width and height of the icon like 20,32 or 48 . All icons are square. The 'name' can include the status like 'on', 'off' or 'locked'. The status Imagename property of Appliance or Module, contains the full icon name, including the status.

$$
\begin{aligned}
& <\% \\
& \text { for }
\end{aligned}
$$

foreach Plugwise.Appliances
echo .Name,': ',.StatusImageName,' <img src="',Plugwise.ImagesPath,'32/',.StatusImageName,'.png"><br>' /foreach
\%>

## Generating graphs

The same graphs as shown in the Reports screen of Source can be generated via the url /pwgraph/?parameters. In a script you can use Plugwise.GraphsPath as the base path. For 'parameters' see following table. Except 'width' and 'height', all parameters are optional.

| Parameter | Purpose | Default |
| :--- | :--- | :--- |
| from=date | Start date of the period in format YYYY-MM-DD | today |
| to=date | End date of the period in format YYYY-MM-DD | Same as start date |
| interval=interval | Data interval: $\mathrm{y}=$ year, $\mathrm{m}=$ month, $\mathrm{w}=\mathrm{week}, \mathrm{d}=$ day, $\mathrm{h}=$ hour | hour |
| view=type | Type of view: $\mathrm{u}=$ usage/production, $\mathrm{e}=\mathrm{CO}_{2}$ emission, $\mathrm{c}=$ costs. | usage/production |
| legend=show | Show or hide the graph's legend: 1 or on $=$ show, 0 or off $=$ hide | show legend |
| title=text | Title on graph | no title |
| zoom=factor | Resize graph by factor. Using a factor $<1$ gives better image quality than letting the <br> browser resize the image on display. | 1, no resizing |
| appids=ids | List of comma separated appliance ids for which to show the graph. | all appliances |
| grpids=ids | List of comma separated group ids for which to show the graph. | all appliances |
| rmids=ids | List of comma separated room ids for which to show the graph. | all appliances |
| width=width | Width of graph in pixels. | mandatory |
| height=height | Height of graph in pixels. | mandatory |

A custom color scheme for the graph can be set with the Plugwise.SetColorScheme(array) method (see also the Plugwise object in this document). The color scheme is only valid within the same session, so different users can have different color schemes at the same time.
A color represents an ARGB value, this is a 32 bit value where the highest 8 bits define the alpha component (transparency), the following 8 bits the red component, next the green component and then the blue component. For example, 0x00ff0000 represents red, 0xff represents blue and 0x80ffffff is half transparent white.

| Name | Purpose | Default |
| :--- | :--- | :--- |
| background | Background color | Oxffffff (white) |
| edge | Edge of the graph | 0xffffff (white) |
| border | Border of the image | Oxfffff (white) |
| grid | Grid (horizontal reference lines) in graph | 0xd0d0d0 (light grey) |
| labels | Text labels | 0x000000 (black) |
| usage | Usage representation, also off-peak | 0x8d96c8 (blue) |
| production | Production representation, also off-peak | 0x8dc78f (green) |
| peakusage | Peak usage representation | 0xbac9ff (light blue) |
| peakproduction | Peak production representation | 0x9bff97 (light green) |
| totalusage | Total usage line | 0x800000 (red) |
| totalproduction | Total production line | 0x8000 (green) |

To prevent unnecessary processing, the webserver uses a simple caching mechanism. Every served graph is saved for 1 minute based on the request string. When a graph is requested the webserver will look for a cached image of less than 1 minute old, that was generated with exactly the same request string and colorscheme. If found, the existing image is server, if not, a new graph is generated, saved and served.

## General remarks

## Operator precedence

The engine does not (yet) support operator precedence; i.e. 'multiply' '*' normally has precedence over 'add' ' + '. Instead expressions are evaluated from right to left. Use round brackets to assure the correct order in calculations.

| Example | Result |
| :--- | :--- |
| $\$ a=5+4 * 3$ | 17 |
| $\$ a=4 * 3+5$ | 32 |
| $\$ a=(4 * 3)+5$ | 17 |

## Forms

When using HTML POST forms, you can combine form fields in an array by using square brackets in the field name:

```
<html><body><%
// set to posted values or an empty array
$cks=Request.Post['ck'] || {}
echo $cks // Show the contents of the array
$flds={'One','Two','Three'}
%><form method="POST" ><%
foreach $flds
    $v='chk_'+$_Index
// keep the checkboxes checked that were checked by the user
%><%=$ Index%>
    <inpūt type="checkbox" name="ck[]" value="<%=$v%>" <%=$cks.ContainsValue($v)?'
checked':''%>>
    <%=$ Value%><br><%
/foreach
%><input type="submit" Value="Submit">
</form>
</body></html>
```

You can also use keys. Note that here the keys do not require to be enclosed in quotation marks:

```
<html><body><%
// set to posted values or an empty array
$cks=Request.Post['ck'] || {}
echo $cks // Show the contents of the array
$flds={'1st'=>'One','2nd'=>'Two','3rd'=>'Three'}
%><form method="POST" ><%
foreach $flds
    // keep the checkboxes checked that were checked by the user
%><%=$ Index%>
    <inpūt type="checkbox" name="ck[<%=$_Key%>]" value="<%=$_Value%>"
<%=$cks.ContainsKey($_key)?' checked':''%>>
    <%=$ Value%><br><%
/foreach
%><input type="submit" Value="Submit">
</form>
</body></html>
```

## Browser sessions

The engine uses a server side cookie called '_PLUSID_' to store the session id of the http client (i.e. browser). If the client does not support cookies, you can create a session by adding a '_PLUSID_' parameter with a (unique) value to the URL:
http://server:8080/sessiontest.html?_PLUSID_=12345

## Syntax highlighting

No editor supports the PTE syntax by default, but most will do a decent job when the syntax is set to PHP. In our experience PSPad (http://www.pspad.com/) handles this very well. Start PSPad and open the program setting dialog via Settings $\rightarrow$ Program Settings In left column select Multihighlighter

- Check Enable HTML Multi-highlighter
- Set For <\%..\%> use to PHP
- Under Open in Multi-highlighter check PHP

Optionally you can make PSPad the default editor for PTE files:
In left column select Registered File Types

- Under Type: fill in .pte and press Add New
